Information on Salmonella

What is salmonellosis?

Salmonellosis is an infection with bacteria called *Salmonella*. Most persons infected with *Salmonella* develop diarrhea, fever, and abdominal cramps 12 to 72 hours after infection. The illness usually lasts 4 to 7 days, and most persons recover without treatment. However, in some persons, the diarrhea may be so severe that the patient needs to be hospitalized. In these patients, the *Salmonella* infection may spread from the intestines to the blood stream, and then to other body sites and can cause death unless the person is treated promptly with antibiotics. The elderly, infants, and those with impaired immune systems are more likely to have a severe illness.

How can Salmonella infections be treated?

Salmonella infections usually resolve in 5-7 days and often do not require treatment other than oral fluids. Persons with severe diarrhea may require rehydration with intravenous fluids. Antibiotics, such as ampicillin, trimethoprim-sulfamethoxazole, or ciprofloxacin, are not usually necessary unless the infection spreads from the intestines. Some *Salmonella* bacteria have become resistant to antibiotics, largely as a result of the use of antibiotics to promote the growth of food animals.

Consumer Advice

FDA recommends that consumers avoid eating products that have been recalled and discard them. Because identification of products subject to recall is continuing, the FDA urges consumers to postpone eating commercially-prepared or manufactured peanut butter-containing products and institutionally-served peanut butter until further information becomes available about which products may be affected. Efforts to specifically identify those products are ongoing. At this time, there is no indication that any national name brand jars of peanut butter sold in retail stores are linked to the PCA recall.

For Retailers

Stop selling recalled products.

For Directors of Institutions and Food Service Establishments

Ensure that they are not serving recalled products.
