

EEE DETECTED IN NEWAYGO COUNTY HORSE

August 27 – District Health Department #10 (DHD#10) was recently notified by the Michigan Department of Agriculture and Rural Development (MDARD) that a horse in Newaygo County has tested positive for Eastern Equine Encephalitis (EEE). This horse is the third one to test positive for EEE in the state so far this year.

EEE is a zoonotic, viral disease, transmitted by mosquitoes to both animals and people. EEE is one of the most dangerous mosquito-borne diseases in the U.S., and the virus is typically seen in late summer to early fall each year in Michigan.

While horses are highly affected by the disease, people can also be infected with EEE from the bite of a mosquito carrying the virus. In humans, signs of EEE include the sudden onset of fever, chills, and body and joint aches. EEE infection can develop into severe encephalitis, resulting in headache, disorientation, tremors, seizures, and paralysis. Permanent brain damage, coma, and death may also occur in some cases.

To protect your horses and other domestic animals (such as dogs, sheep, and goats), measures could include the following:

- Talking to a veterinarian about vaccinating horses against EEE.
- Placing livestock in a barn under fans (as mosquitos are not strong flyers) during peak mosquito activity from dusk to dawn.
- Using an insect repellent on an animal that is approved for the species.
- Eliminating standing water on the property—i.e., fill in puddles, repair eaves, and change the water in buckets and bowls at least once a day.
- Contacting a veterinarian if an animal shows signs of the illness: fever and stumbling, which can progress to being down and struggling to stand.

To protect yourself and your family, here's what you should do now:

- Apply insect repellents that contain the active ingredient DEET, or other U.S. Environmental Protection Agency-approved products, to exposed skin or clothing and always follow the manufacturer's directions for use.
- Wear long-sleeved shirts and long pants when outdoors. Apply insect repellent to clothing to help prevent bites.
- Maintain window and door screening to help keep mosquitoes outside.
- Empty water from mosquito breeding sites around the home, such as buckets, unused children's pools, old tires, or similar sites where mosquitoes may lay eggs.
- Use nets and/or fans over outdoor eating areas. Overall, mosquito-borne illnesses, like EEE, will continue to pose a risk to both animals and humans until late fall when nighttime temperatures consistently fall below freezing.

DHD#10 has ongoing mosquito trapping program in Newaygo and Oceana counties.
