VACCINE POLICY STATEMENT

Below is our statement of support for the vital role vaccination plays in safeguarding the health of all of us, children or adult

We firmly believe in the effectiveness of vaccines to prevent serious illness and to save lives.

We firmly believe in the safety of our vaccines.

We firmly believe that all children and adults should receive all of the recommended vaccines according to the schedule published by the Centers for Disease Control, Prevention, American Academy of Pediatrics, American College of Obstetrics and Gynecology, and American Academy of Family Physicians.

We firmly believe, based on all available literature, evidence, and current studies, that vaccines do not cause autism or other developmental disabilities. We firmly believe that thimerosal, a preservative that has been in vaccines for decades and remains in very few vaccines, does not cause autism or other developmental disabilities.

We firmly believe that vaccinating children and adults may be the single most important health-promoting intervention we perform as healthcare providers, and that you can choose for yourself and your families. The recommended vaccines and the vaccine schedule are the results of years and years of scientific study and data gathered on millions of children and adults by thousands of our brightest scientists and physicians.

This said, we recognize that there has always been and will likely always be controversy surrounding vaccination. Indeed, Benjamin Franklin, persuaded by his brother, was opposed to smallpox vaccine until scientific data convinced him otherwise. Tragically, he had delayed inoculating his favorite son Franky.

The boy contracted smallpox and died at the age of 4, leaving Franklin with a lifetime of guilt and remorse. In his autobiography, Franklin wrote:

"In 1736, I lost one of my sons, a fine boy of four years old, by the smallpox...I long regretted bitterly, and still regret that I had not given it to him by inoculation. This I mention for the sake of parents who omit that operation, on the supposition that they should never forgive themselves if a child died under it, my example showing that the regret may be the same either way, and that, therefore, the safer should be chosen."

The vaccine campaign is truly a victim of its own success. It is precisely because vaccines are so effective at preventing illness that we are even discussing whether or not they should be given. Because of vaccines, many have never seen someone with polio, tetanus, whooping cough, bacterial meningitis, or even chickenpox, or known a friend or family member whose child died of one of these diseases. Such success can make us complacent or even lazy about vaccinating.

But such an attitude, if it becomes widespread, can only lead to tragic results. After publication of an unfounded accusation (later retracted) that MMR vaccine caused autism in 1998, many Europeans chose not to vaccinate their children. As a result of underimmunization, Europe experienced large outbreaks of measles, with several deaths from disease complications. In 2012, there were more than 48,000 cases of pertussis (whooping cough) in the United States, resulting in 22 deaths. Most victims were infants younger than six months of age. Many children who contracted the illness had parents who made a conscious decision not to vaccinate. In 2015, there was a measles outbreak in Disneyland, California probably started by an infected park visitor who had traveled from the Philippines. The outbreak eventually spread to 147 people and, again, many were too young to have been vaccinated.

When you don't vaccinate or chose to not have your child vaccinated, you take a significant risk with your or your child's health and the health of those around you. We are making you aware of these facts not to scare you or coerce you, but to emphasize the importance of vaccinating your child and yourself. We recognize that the choice may be a very emotional one for some. We will do everything we can to assure you that vaccinating according to the schedule is the right thing to do.

However, should you have doubts, please discuss these with your healthcare provider in advance of your visit. Please be advised, that delaying or "breaking up the vaccines" to give one or two at a time over two or more visits goes against expert recommendations, and can put your child at risk for serious illness (or even death), puts your child through more potentially painful experiences, and goes against our medical advice as providers at District Health Department #10. In rare cases will we consider altering the schedule to accommodate parental concerns or reservations. Such additional visits will require additional co-pays on your part. Please realize that you will also be required to sign a "Refusal to Vaccinate" acknowledgement in the event of lengthy delays.

As medical professionals, we feel very strongly that vaccinating your child on schedule with currently available vaccines is absolutely the right thing to do to protect all children and adults.

Thank you for taking the time to read this policy. Please feel free to discuss any questions or concerns you may have about vaccines with any one of us and request any additional information we could provide for you.
